Install GitHub Copilot CLI

IMPORTANT - This page is WIP!!!

Background

GitHub Copilot CLI is a **command-line interface** that brings Copilot's AI capabilities directly into your terminal. Instead of switching to an IDE, you can:

- **Generate scripts** (e.g., Bash, PowerShell) on the fly.
- **Explain or refactor code** without leaving the shell.
- **Run commands and automate workflows** using natural language.
- Interact with GitHub (list pull requests, create issues) from the terminal.

Issues

Id	Summary	Details	Comment
1	CLI Login from Windows	After install, I can't get to https://westpac.ghe.com from the command line to login	This is a showstopper for now
2	Models	You can't change model at this time, uses premium credits at 1x token usage	On Mac this is fixed to Claude-sonnet-4.5

Caveats

This is an interim page to help developers to install CLI - this will likely be replaced at a later date so search before proceeding

Dependencies

Copilot CLI has a dependency on NodeJS 22 and NPM - for the upto date dependencies refer to the official GitHub Copilot CLI page.

Windows 11

Install Chocolatey

For those that have not installed Chocolatey from Mesh, you can install Chocolatey

1. Download https://artifactory.srv.westpac.com.au/ui/repos/tree/General/A008E6_EDP-chocolatey-release/setup.zip
2. Unzip the file
3. Double-click on chocolateydeveloper.bat (DON'T Run as Admin!)
4. When prompted enter your Westpac password - this is used to authenticate with Artifactory
5. Restart (yes restart!)

Install Nodejs2

In a Powershell or Command Prompt, install nodejs

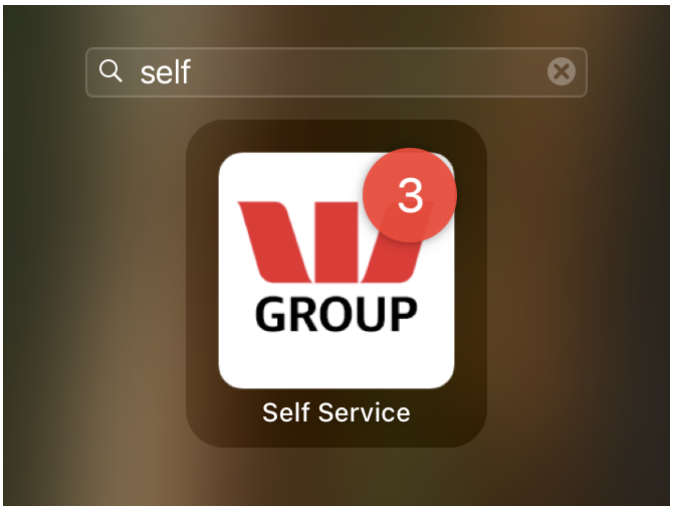
Install Nodejs

```
> choco install -s=artifactory nodejs22
```

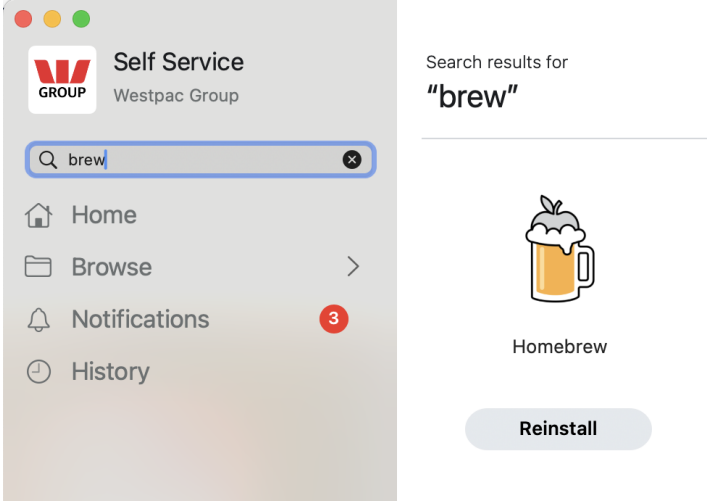
Mac

Install Homebrew

using the Self Service app on you Mac:



Search and install "Homebrew"



Install Nodejs22

Open a Terminal and install nodejs

Install NodeJS 22
`> brew install nodejs@22`

Install Copilot

Open a PowerShell or Command Prompt and type the following command:

Install Copilot CLI
`> npm install -g @github/copilot`

Test install by running Copilot, in a Terminal (Mac) or Powershell/Command Prompt (Windows)

Launch Copilot

```
> copilot
```

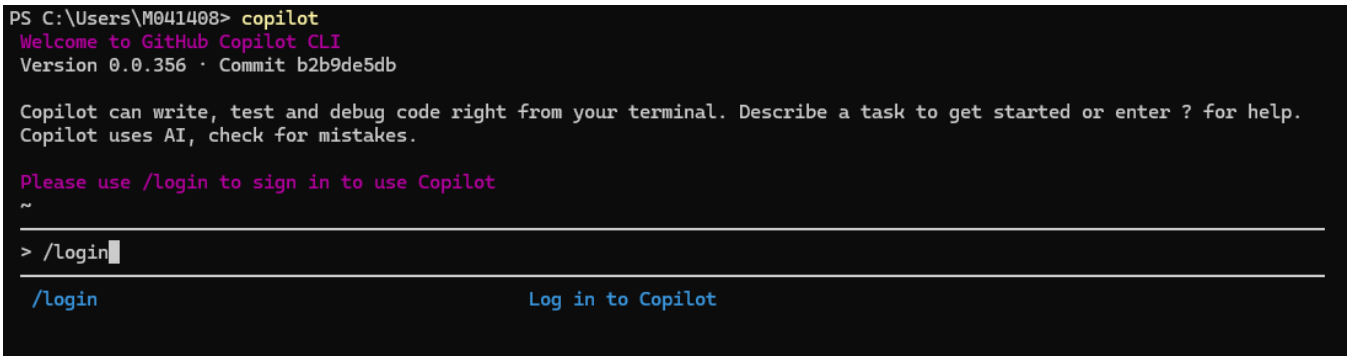
If everything worked you should see this:

Login to GitHub Enterprise within Copilot

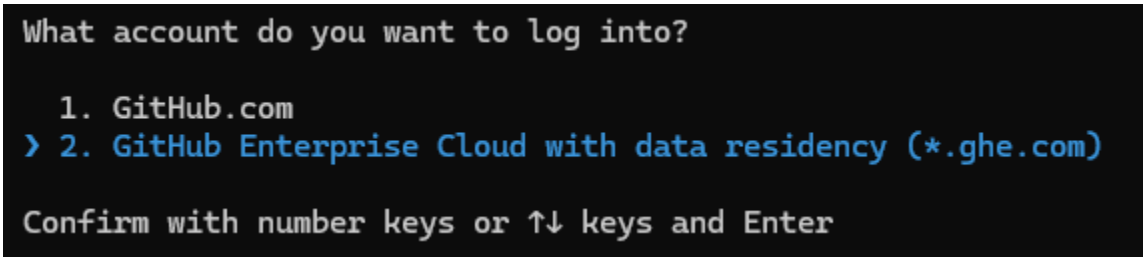
Before you can use Copliot, you need to log. Within copilot you need to use the /login command:

Login

```
> /login
```



As the account type, select GitHub Enterprise!



At the address type "https://westpac.ghe.com"

```
● Disconnected from GitHub MCP Server

 Enter your GitHub Enterprise instance URL:

 https://westpac.ghe.com
```

(**ISSUE**: Windows Doesn't connect :(!)

You will get a One Time Code...

```
⠋ Waiting for authorization...

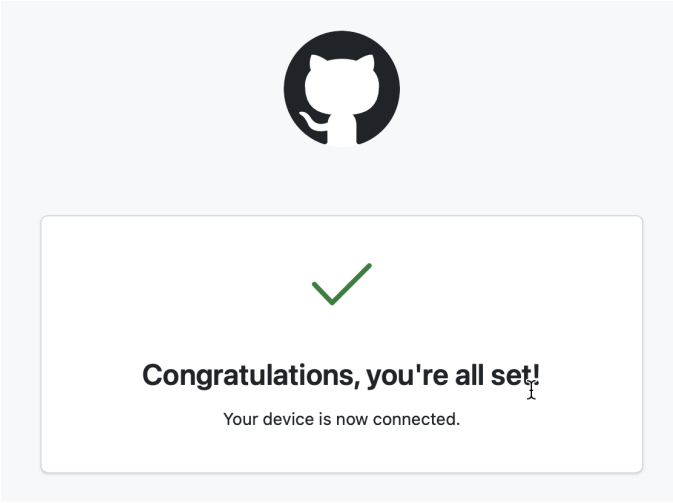
Enter one-time code: 1875-FFE4 at https://westpac.ghe.com/login/device

Press any key to copy to clipboard and open browser...
```

Press any key and it will copy and open browser.

Click on the Authorise button, paste the key (this is already in your clipboard, just paste 🙂

And that is it! You should see



You can return to Copilot and should see something like:

```
● Connected to GitHub MCP Server
● Signed in successfully as M041408 (https://westpac.ghe.com)! You can now use Copilot.
~/Documents                                                    claude-sonnet-4.5 (1x)
> Enter @ to mention files or / for commands
Ctrl+c Exit · Ctrl+r Expand recent
```

After that you are done!
